ABSTRACT

This bibliography lists approximately 130 references concerning children with attention deficit hyperactivity disorder (ADHD). An introduction briefly describes the scope of what is being included under this term. It then lists the Library of Congress subject headings which are relevant to the topic. The citations include author, title, an annotation (occasionally), and the Library of Congress cataloging number. Citations are listed under the following categories: basic texts, books for children and younger readers, books for adolescents and teens, books for adults with ADHD, books for parents, books for teachers and educators, books for practitioners and clinicians, books on therapy and treatment, personal narratives, related titles, bibliographies, directories, journals, journal articles, abstracting and indexing services (with relevant subject terms), and organizational resources. ATTENTION DEFICIT-HYPERACTIVITY DISORDER (ADHD)

Compiled by Michelle Cadoree

TB 97-3 **August 1997**

SCOPE: Attention Deficit Hyperactivity Disorder (ADHD), also referred to as Attention Deficit Disorder (ADD), is a neurobiological condition affecting children and adults. Symptoms include easy distractibility, impulsiveness, and in some cases hyperactivity. The American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders*, fourth edition (DSM IV) defines an adult or child as having the ADHD disorder if there is "a persistent pattern of inattention and/or hyperactivity-impulsivity that is more frequent and severe than is typically observed in individuals at a comparable level of development;" if "some hyperactive-impulsive or inattentive symptoms that cause impairment have been present before age 7 years;" if some impairments are present in at least two settings; and "there is clear evidence of interference with developmentally appropriate social, academic, or occupational functioning."

ADHD, once called hyperkinesis or minimal brain dysfunction, is one of the most common mental disorders among children, affecting 3 to 5 percent of all children. ADHD can also continue into adolescence and adulthood. In the last decade a variety of medications, behavior-changing therapies, and educational options have become available for treatment of children and adults with ADHD. Medications for treatment of ADHD include methylphenidate (Ritalin), dextroamphetamine, (Dexedrine or Dextrostat), and pemoline (Cylert). For many people these stimulant medications reduce hyperactivity and improve ability to focus, learn, and work. Use of these drugs has sparked controversy because of the possible side-effects and because many feel that they are prescribed unnecessarily for too many children.

Medication can help control some of the behavior problems, but more often, there are other aspects which medication cannot treat. For that reason treatment for ADHD is usually multimodal, involving both drug and behavioral therapy. Intervention approaches sometimes involve the whole family and can include psychotherapy, cognitive-behavioral therapy, social skills training, and parenting training. Other treatments have included diet therapy and holistic medicine.

Many adults with ADHD and parents of children with ADHD find support groups to be very helpful. National associations listed at the end of this guide can provide further referral to local chapters and appropriate information. There are also a number of on-line bulletin boards and resources available over the Internet.

Not meant to be a comprehensive bibliography, this Tracer Bullet is designed -- as

EC 306264

the name of the series implies -- to put the reader "on target".
